## Outline

- The wireless explosion
- Moving Object Data and Mobility Data Analysis
- Moving Object Databases
- Spatio-Temporal Data Mining for Moving Object Trajectories

## The Wireless Explosion

- A lot of effort has been devoted to the development of efficient software for mobile devices as
  - ◆ Palm-tops
  - ◆ GPS
  - ◆ Cell Phone
  - ◆ Sensor networks, etc.
- ....while....
- very little has been done to analyze the data generated by mobile devices: *Trajectories of Moving Objects* (new kind of data)

## The Wireless Explosion (Fosca Giannotti 2007 – [www.geopkdd.eu](http://www.geopkdd.eu))

*Do you use any of these devices ?*

*Do you ever feel that you are tracked?*

## The Wireless Explosion

### Mobile phones demystify commuter rat race

Tracking study proves that humans are creatures of habit.

**Key Points**

- Researchers have come up with a new use for the ubiquitous mobile phone: tracking human movements. By monitoring the signals from 100,000 mobile-phone users sending and receiving calls and text messages, a team from Northeastern University in Boston, Massachusetts, has worked out some apparently universal laws of human motion.

Researchers monitored the everyday movements of 100,000 people by tracking their phones.

## Trajectories of Moving Objects

### Limited to fixed traffic signs

### Traffic reports:

- Range query: How many cars in the free way?
- Shortest path query: What is the estimated travel time to reach my destination?

### Store finder:

- Range query: What are the restaurants within five KM of my location?

### Advertisement:

- Range query: Send E-coupons to all customers within five KM of my store

## Mobility Data Analysis

- How people move around in the town
  - During the day, during the week, etc.
- Are there typical movement behaviours? In a certain area at a certain time?
- How are people movement habits changing in this area in last decade-year-month-day?
- Are there relations between movements of two areas?
- Are there periodic movements?

## Trajectory Data (Fosca Giannotti 2007 – www.geopkdd.eu)

- Spatio-temporal Data
- Represented by a set of points located in space and time (time-stamped coordinates)
- $T = (t_1, x_1, y_1), \dots, (t_n, x_n, y_n) \Rightarrow$  position at time  $t_i$  was  $(x_i, y_i)$

## Trajectories: Basic Concepts (Adrienko 2008)

- Trajectories have to be represented by finite sequences of time-referenced locations. There are several ways to observe movements:

- time-based recording: positions of entities are recorded at regularly spaced time moments
  - e.g. every 5 minutes
- change-based recording: a record is made when the position of an entity differs from the previous one;
- location-based recording: records are made when an entity comes close to specific locations
  - e.g. where sensors are installed
- event-based recording: positions and times are recorded when certain events occur
  - e.g. calling by a mobile phone

- Typically, positions are measured with uncertainty.

## Trajectories: Overall Characteristics (Adrienko 2008)

- Geometric shape
- Length (traveled distance)
- Duration (in time)
- Speed
  - Mean, median, and maximal Speed
  - Periods of constant speed, acceleration, deceleration
- Direction:
  - Periods of straight, curvilinear, circular movement;
  - Major turns ('turning points') in: time, position, angle, initial and final directions, and speed in the moment of the turn;

## Relationships

Many types of relationships may be of interest, depending on the problem in hand:

- **similarity or difference of the overall characteristics of the trajectories**  
e.g. shapes, travelled distances, durations, dynamics of speed and directions)
- **spatial and temporal relationships:**
  - **co-location in space** (i.e. the trajectories consist of the same positions or have some positions in common):
  - **co-existence in time** (i.e. the trajectories are made during the same time period or the periods overlap);
  - **co-incidence in space and time** (i.e. same positions are attained at the same time);
  - distances in space and in time.

## Raw Trajectory Data: Problems and Solutions

## The trajectory reconstruction problem

(Theodoridis and Pelekis 2007)

- From raw location data (tid, x, y, t)

a sample of a  
user's movement  
(GPS recordings)

- To trajectory data (obj-id, traj-id, (x, y, t))

a sample of  
reconstructed  
trajectories

## Trajectory stream manager

(Theodoridis and Pelekis 2007)

- Trajectory stream manager operations
  - ◆ reconstructs trajectories (excluding noise, etc.) and posts trajectory data to a MOD (Moving Object Database)
- Results so far – 2 alternatives
  - ◆ Assumptions about trajectory 'birth' (for spatial/temporal gaps between traces)
  - ◆ Studying the notion of 'stop' (suspension of an entity's movement)

## Trajectory stream manager (now...) (1)

(Theodoridis and Pelekis 2007)

- When will an object have assigned a new trajectory-id?

- ◆ When there is sufficiently large gap in the spatial dimension between two consecutive recorded positions

- ◆ When there is sufficiently large gap in the temporal dimension between two consecutive recorded positions

## Moving Object Databases

### Moving Object Databases: History

- Is a quite new research field
  - ◆ Main researchers: Ralf Harmut Guting and Ouri Wolfson
  - ◆ More recently, Yannis Theodoridis/ Nikos Pelekis

Outubro/2008

Tutorial on Spatial and Spatio-Temporal Data Mining (SBBD-2008)

19

### Moving Object Databases: Applications

- ◆ Traffic Analysis and Management
- ◆ Analysis of Movements of People (Customers)
- ◆ Environmental Studies
- ◆ Biology (E.G. Animal Behaviour, Tracking)
- ◆ Meteorology
- ◆ History
- ◆ ....

Outubro/2008

Tutorial on Spatial and Spatio-Temporal Data Mining (SBBD-2008)

20

### Moving Object Database Technology

(Wolfson 1999)

- **Past Query:**
  - ◆ During the past year, how many times was bus 5 late in more than 10 minutes at station X?
- **Trigger:**
  - ◆ Send me a message when an airplane arrives in a given geographic area
- **Future Query:**
  - ◆ Which trucks will reach destination within 20 minutes?
- **Present Query:** Where are the taxis within 1 KM of my location?

Outubro/2008

Tutorial on Spatial and Spatio-Temporal Data Mining (SBBD-2008)

21

### Moving Object Database: Operations

- Research on *Moving Object Databases* (MODs) has addressed the need for representing movements of objects to:
  - ◆ **perform ad-hoc querying**
  - ◆ **analysis**
  - ◆ **data mining**
- During the last decade, research has focused on:
  - ◆ **data models**
  - ◆ **query languages**
  - ◆ **implementation aspects (e.g. efficient indexing, query processing and optimization techniques)**

23

*Secondo*

University of Hagen

## Data Types (Guting 1999)

- Data Types *mpoint* and *mregion* are mappings from time into space:
  - $mpoint = time \rightarrow point$
  - $mregion = time \rightarrow region$
- Examples:
  - flight** (id: string, origin: string, dest: string, route: *mpoint*)
  - weather** (id: string, kind: string, area: *mregion*)

Outubro/2008

Tutorial on Spatial and Spatio-Temporal Data Mining (SBBD-2008)

25

## Spatio-Temporal Operations (Guting 1999)

The data types include suitable operations such as:

- Intersection** (*mpoint*, *mregion*)  $\rightarrow$  *mpoint*

- distance** (*mpoint*, *mpoint*)  $\rightarrow$  *mreal*

- Trajectory** (*mpoint*)  $\rightarrow$  *line*

- Deftime** (*mpoint*)  $\rightarrow$  *period*

- length** (*line*)  $\rightarrow$  *real*

Outubro/2008

Tutorial on Spatial and Spatio-Temporal Data Mining (SBBD-2008)

26

## Spatio-Temporal Queries

- flight** (id: string, origin: string, dest: string, route: *mpoint*)

Query 1: "Find all flights from Sao Paulo that are longer than 4000 km."  
**SELECT \***  
**FROM flights**  
**WHERE origin = 'SP' AND length(trajectory(route)) > 4000**

Query 2: "Retrieve any pairs of air planes that during their flight came closer to each other than 500 meters!"  
**SELECT f.id, g.id**  
**FROM flights f, flights g**  
**WHERE f.id <> g.id AND min(distance(f.route, g.route)) < 0.5**

Outubro/2008

Tutorial on Spatial and Spatio-Temporal Data Mining (SBBD-2008)

27

## General Characteristics

- ❖ An environment for research prototyping and teaching
- ❖ Developed in the last ten years at University of Hagen, Germany
  - ✦ system frame can be filled with implementations of different data models, e.g. relational, object-relational, etc
- ❖ Implemented in algebra
- ❖ Basically a relational system with several advanced data type packages
- ❖ Open source software, available at
- ❖ <http://dna.fernuni-hagen.de/Secondo.html/index.html>

Outubro/2008

Tutorial on Spatial and Spatio-Temporal Data Mining (SBBD-2008)

28

## Architecture

- Consists of:
  - a *kernel*, which offers query processing over a set of implemented algebras,
  - an *optimizer*, which implements the essential part of an SQL-like language, and
  - an *extensible* GUI where new data types and models can provide specialized views for moving objects

Hermes

University of Pireaus

## Hermes - Engine

(Theodoridis and Pelekis 2007)

- Principles
  - ◆ Spatial and temporal dimensions
  - ◆ HERMES Moving Data Cartridge (MDC) On top of Oracle extensible DBMS
- Trajectory management
  - ◆ Insert/Update/Delete a moving object or a segment of its trajectory
  - ◆ Works over trajectories or sets of trajectories
- Data management
  - ◆ Supported indices: R-tree
  - ◆ Ongoing task: Development of a specialized index (TB-tree)
- Flexible system

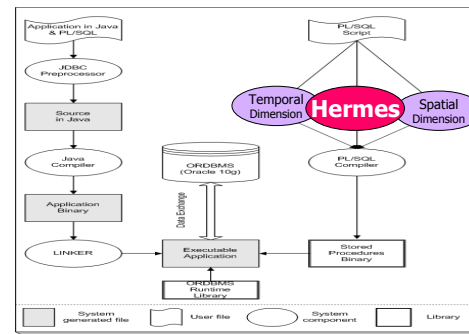

Outubro/2008

31

## HERMES prototype architecture

(Theodoridis and Pelekis 2007)

Outubro/2008

Tutorial on Spatial and Spatio-Temporal Data Mining (SBBD-2008)

32

## Hermes - Similarity Queries

(Theodoridis and Pelekis 2007)

- **Spatial similarity** (time is not taken into consideration):
  - ◆ Find objects whose *route* is quite similar to that of object id=132 (irrespective of time).
- **Spatio-temporal similarity** (time is taken into consideration):
  - ◆ Find objects that follow a route similar to that of object id=132 during the same time interval, e.g. from 3 to 6 pm.
- **Speed-pattern similarity**:  
Find objects moving with a similar speed pattern
  - ◆ e.g. mid speed for about half an hour and high speed for the next two hours
- **Direction-pattern similarity**:  
Find objects moving with a similar direction pattern
  - ◆ e.g. NE during the first half of the route and then W

Outubro/2008

Tutorial on Spatial and Spatio-Temporal Data Mining (SBBD-2008)

33

## Distance-Based & NN Queries

(Theodoridis and Pelekis 2007)

- **Distance-based query**
  - ◆ **stationary reference object**
    - ◆ Find shops close to me (e.g. less than 100m) offering sportswear
  - ◆ **moving reference object**
    - ◆ Find humans who have passed close (e.g., less than 100 m) to me and have already requested sportswear
- **Nearest-Neighbor query**
  - ◆ **stationary reference object**
    - ◆ Find the two nearest shops to my current location
  - ◆ **moving reference object**
    - ◆ Find the two nearest trajectories to my route

Outubro/2008

Tutorial on Spatial and Spatio-Temporal Data Mining (SBBD-2008)

34

## Distance and buffer

- Generates a buffer polygon around a point at a specific timestamp
  - ◆ **f\_buffer** (distance NUMBER, tolerance NUMBER, tp tau\_til.d\_timestamp\_sec) RETURN MDSYS.SDO\_GEOMETRY,
- Computes the distance between two moving points at a specific timestamp. The distance between two geometry objects is the distance between the closest pair of points or segments of the two objects
  - ◆ **f\_distance** (moving\_point moving\_point, tolerance NUMBER, tp tau\_til.d\_timestamp\_sec) RETURN NUMBER,
- Determines if a moving point is within some specified Euclidean distance from other geometry objects at a specific timestamp
  - ◆ **f\_within\_distance** (distance NUMBER, geom MDSYS.SDO\_GEOMETRY, tolerance NUMBER, tp tau\_til.d\_timestamp\_sec) RETURN VARCHAR2,

Outubro/2008

Tutorial on Spatial and Spatio-Temporal Data Mining (SBBD-2008)

35

## Direction Relationships

- Returns TRUE for objects being east of moving point at the given timestamp
  - ◆ **f\_east** (geom MDSYS.SDO\_GEOMETRY, tp tau\_til.d\_timestamp\_sec, angle\_min NUMBER, angle\_max NUMBER) RETURN NUMBER,
- Returns TRUE for objects being west of moving point at the given timestamp
  - ◆ **f\_west** (geom MDSYS.SDO\_GEOMETRY, tp tau\_til.d\_timestamp\_sec, angle\_min NUMBER, angle\_max NUMBER) RETURN NUMBER,
- Returns TRUE when the moving point is between the multi-geometry at the given timestamp
  - ◆ **f\_between** (geom MDSYS.SDO\_GEOMETRY, tp tau\_til.d\_timestamp\_sec) RETURN NUMBER,
- Returns TRUE for objects being in front of moving point at the given timestamp
  - ◆ **f\_front** (geom MDSYS.SDO\_GEOMETRY, tp tau\_til.d\_timestamp\_sec, angle\_min NUMBER, angle\_max NUMBER) RETURN NUMBER,
- Returns TRUE for objects being behind of moving point at the given timestamp
  - ◆ **f\_behind** (geom MDSYS.SDO\_GEOMETRY, tp tau\_til.d\_timestamp\_sec, angle\_min NUMBER, angle\_max NUMBER) RETURN NUMBER,

Outubro/2008

Tutorial on Spatial and Spatio-Temporal Data Mining (SBBD-2008)

36

## Topological Queries

Theodoridis and Pelekis 2007

- Find humans *crossing* a street
- Find areas whose boundaries *touch* humans' routes
- When did a human enter the area of his departing gate?
- Which was the entering point?

Outubro/2008

Tutorial on Spatial and Spatio-Temporal Data Mining (SBBD-2008)

37

## Topological Relationships

- Returns a geometry object that is the topological intersection (AND operation) of an instanced point at a specific timepoint with another geometry object
  - f\_intersection** (geom MDSYS.SDO\_GEOMETRY, tolerance NUMBER, tp tau\_tll.d\_timepoint\_sec) RETURN MDSYS.SDO\_GEOMETRY,
- Returns a moving point that is the restriction (intersection) of the calling moving point inside the polygon argument
  - f\_intersection** (geom MDSYS.SDO\_GEOMETRY, tolerance NUMBER) RETURN moving\_point,
- Returns a geometry object that is the topological union (OR operation) of an instanced point with this moving point at a specific timepoint
  - f\_union** (moving\_point moving\_point, tolerance NUMBER, tp tau\_tll.d\_timepoint\_sec) RETURN MDSYS.SDO\_GEOMETRY,
- Examines current Moving\_Point to determine its spatial relationship with another moving point
  - f\_relate** (MASK VARCHAR2, moving\_point moving\_point, tolerance NUMBER, tp tau\_tll.d\_timepoint\_sec) RETURN VARCHAR2,

Outubro/2008

Tutorial on Spatial and Spatio-Temporal Data Mining (SBBD-2008)

38

## General Spatio-temporal Relationships

- Return the enter and leave points of the moving point for a given geometry
  - get\_enter\_leave\_points** (geom MDSYS.SDO\_GEOMETRY) RETURN MDSYS.SDO\_GEOMETRY,
- Returns the Point (spatial coordinates) of the Moving\_Point at a specific timepoint
  - at\_instant** (tp tau\_tll.d\_timepoint\_sec) RETURN MDSYS.SDO\_GEOMETRY,
- Returns a moving point restricted at a specific period
  - at\_period** (per tau\_tll.d\_period\_sec) RETURN moving\_point,
- Restricts the moving point at the space specified by the linestring parameter which is supposed to be part of his route
  - at\_linestring** (line MDSYS.SDO\_GEOMETRY) RETURN moving\_point,
