

A Two-Level Approximated Logic Synthesis Method Gabriel Ammes, Walter Lau, Paulo Butzen,

Pierre-Emmanuel Gaillardon and Renato Ribas

Approximate computing is a design paradigm that trades off accuracy for improvement in hardware cost and energy efficiency. Approximate logic synthesis (ALS) focuses on automatically synthesizing an optimized circuit that approximately implements the target function according to some error constraints. The objective is to identify an approximate SOP expression with the lowest literal count for a given optimized SOP and a threshold of number-of-errors (NoE).

There are two ways to approximated an SOP: (1) to insert a new cube that allow remove cubes in the SOP, and (2) to directly remove a cube from the SOP. The proposed method flow is presented in Algorithm 1.

,	Algorithm 1: Proposed Method					
	Input: A simplified SOP expression F and a NoE e					
Output: an approximated SOP expression F'						
1	$S_0 \leftarrow F$, best $\leftarrow F$;					
2	2 for $i \leftarrow 0$ to e-1 do					
3	$S_{i+1} \leftarrow CubeInsert(S_i, i+1);$					
4	sr \leftarrow CubeRemove(S _i ,e-i);					
5	if $min(S_{i+1},sr) < best$ then best $\leftarrow min(S_{i+1},sr)$;					
6 end						
7 return espresso(best);						
7	return espresso(best);					

In Figure 1 is presented an execution example for NoE = 2 with Karnaugh map. Figure 1(a) presents the original SOP. The arrows marked with "I" are a *CubeInsert* execution and the ones with "R" a *CubeRemove* execution. The red colored minterms represents an error. *CubeInsert* execution can insert one error more than the last solution whereas *CubeRemove* execution can insert the difference between the last solution error and the NoE threshold.

Figure 1 – Example of execution with NoE = 2										
(a)										
			c ab	00	01	11	10			
			0	0	1	1	1			
			1	0	0	1	0			
(b)				\sim		\geq	_	R	_	(c)
c ab	00	01	11	10		c ab	00	01	11	10
0	0	1	1	1		0	0	0	1	0
1	0	0	1	1		1	0	0	1	0
(d)		ιΓ						R		(e)
c ab	00	01	11	10		c ab	00	01	11	10
0	0	1	1	1		0	0	0	1	1
1	0	1	1	1		1	0	0	1	1

In Table 1 is shown the comparison to the state-of-the-art with a NoE threshold of 16 [1]. In Table 2 is shown our results with NoE equal to ER*2ⁱ.

Table 1 – Comparison considering 16 errors.
